

Residential Rain Garden in Nunaka Valley

BEFORE:

AFTER:

1. After your initial site visit you will know your general rain garden size and location. Your first step is to **EXCAVATE**. This person dug down 2 feet in rocky well-draining soil.

2. Once excavation is complete, you must refill your hole with 60% sand, 40% topsoil. The picture below emphasizes that you should **NOT** fill soil to the top of the hole. Leave 6-8 inches for water to pond.

3. Plant layout! Plants grouped in sets of 3 are pleasing to the eye.
